

## **Creating Other Schema Objects**

**Oracle for Base** 

## **Objectives**

After completing this lesson, you should be able to do the following:

- Create simple and complex views
- Retrieve data from views
- Create, maintain, and use sequences
- Create and maintain indexes
- Create private and public synonyms

#### **Lesson Stanford**

- Overview of views:
  - Creating, modifying, and retrieving data from a view
  - Data manipulation language (DML) operations on a view
  - Dropping a view
- Overview of sequences:
  - Creating, using, and modifying a sequence
  - Cache sequence values
  - NEXTVAL and CURRVAL pseudocolumns
- Overview of indexes
  - Creating, dropping indexes
- Overview of synonyms
  - Creating, dropping synonyms

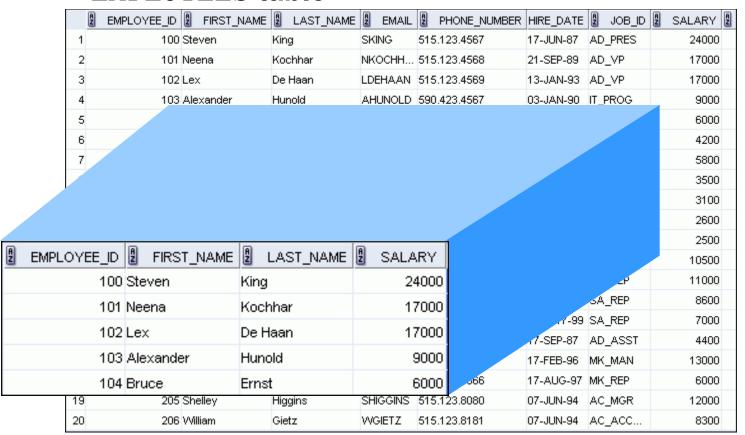

## **Database Objects**

Object	Description
Table	Basic unit of storage; composed of rows
View	Logically represents subsets of data from one or more tables
Sequence	Generates numeric values
Index	Improves the performance of data retrieval queries
Synonym	Gives alternative names to objects

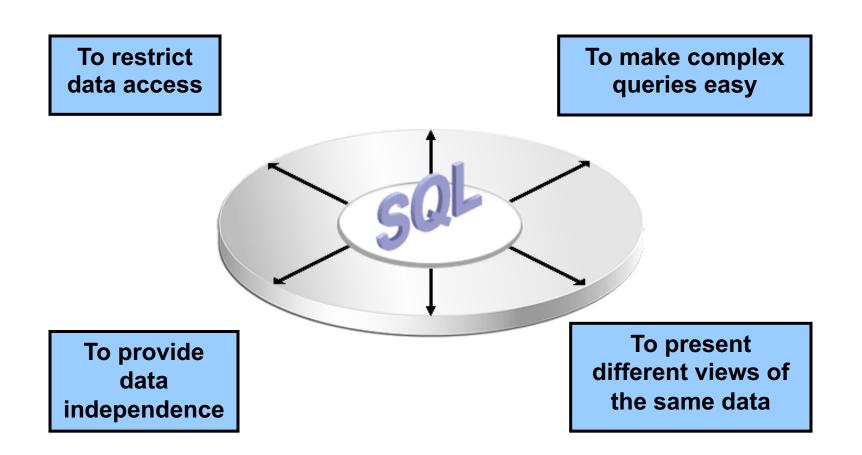

#### What Is a View?

#### **EMPLOYEES table**

## **Advantages of Views**

## **Simple Views and Complex Views**

Feature	Simple Views	Complex Views
Number of tables	One	One or more
Contain functions	No	Yes
Contain groups of data	No	Yes
DML operations through a view	Yes	Not always

## **Creating a View**

You embed a subquery in the CREATE VIEW statement:

```
CREATE [OR REPLACE] [FORCE|NOFORCE] VIEW view
  [(alias[, alias]...)]
AS subquery
[WITH CHECK OPTION [CONSTRAINT constraint]]
[WITH READ ONLY [CONSTRAINT constraint]];
```

The subquery can contain complex SELECT syntax.

## **Creating a View**

• Create the EMPVU80 view, which contains details of the employees in department 80:

```
CREATE VIEW empvu80

AS SELECT employee_id, last_name, salary

FROM employees

WHERE department_id = 80;

CREATE VIEW succeeded.
```

• Describe the structure of the view by using the iSQL\*Plus DESCRIBE command:

```
DESCRIBE empvu80
```

## **Creating a View**

Create a view by using column aliases in the subquery:

Select the columns from this view by the given alias names.

## **Retrieving Data from a View**

```
SELECT *
FROM salvu50;
```

	A	ID_NUMBER	NAME	A	ANN_SALARY
1		124	Mourgos		69600
2		141	Rajs		42000
3		142	Davies		37200
4		143	Matos		31200
5		144	Vargas		30000

## Modifying a View

 Modify the EMPVU80 view by using a CREATE OR REPLACE VIEW clause. Add an alias for each column name:

```
CREATE OR REPLACE VIEW empvu80

(id_number, name, sal, department_id)

AS SELECT employee_id, first_name || ' '

|| last_name, salary, department_id

FROM employees

WHERE department_id = 80;

CREATE OR REPLACE VIEW succeeded.
```

• Column aliases in the CREATE OR REPLACE VIEW clause are listed in the same order as the columns in the subquery.

## **Creating a Complex View**

Create a complex view that contains group functions to display values from two tables:

# Rules for Performing DML Operations on a View

 You can usually perform DML operations on simple views.

- You cannot remove a row if the view contains the following:
  - Group functions
  - A GROUP BY clause
  - The DISTINCT keyword
  - The pseudo column ROWNUM keyword

# Rules for Performing DML Operations on a View

You cannot modify data in a view if it contains:

- Group functions
- A GROUP BY clause
- The DISTINCT keyword
- The pseudo column ROWNUM keyword
- Columns defined by expressions

# Rules for Performing DML Operations on a View

You cannot add data through a view if the view includes:

- Group functions
- A GROUP BY clause
- The DISTINCT keyword
- The pseudo column ROWNUM keyword
- Columns defined by expressions
- NOT NULL columns in the base tables that are not selected by the view

## Removing a View

You can remove a view without losing data because a view is based on underlying tables in the database.

DROP VIEW view;

DROP VIEW empvu80;

DROP VIEW empvu80 succeeded.

#### **Practice 7: Overview**

This practice covers the following topics:

- Creating a simple view
- Creating a complex view
- Creating a view with a check constraint
- Attempting to modify data in the view
- Removing views

#### **Lesson Stanford**

- Overview of views:
  - Creating, modifying, and retrieving data from a view
  - DML operations on a view
  - Dropping a view
- Overview of sequences:
  - Creating, using, and modifying a sequence
  - Cache sequence values
  - NEXTVAL and CURRVAL pseudocolumns
- Overview of indexes
  - Creating, dropping indexes
- Overview of synonyms
  - Creating, dropping synonyms

## **Sequences**

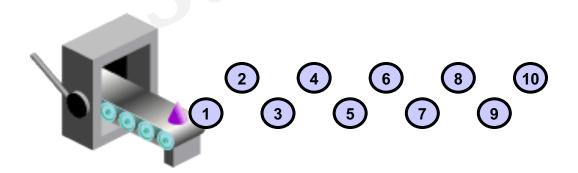

Object	Description
Table	Basic unit of storage; composed of rows
View	Logically represents subsets of data from one or more tables
Sequence	Generates numeric values
Index	Improves the performance of some queries
Synonym	Gives alternative names to objects

#### **Sequences**

#### A sequence:

- Can automatically generate unique numbers
- Is a shareable object
- Can be used to create a primary key value
- Replaces application code
- Speeds up the efficiency of accessing sequence values when cached in memory

# CREATE SEQUENCE Statement: Syntax

Define a sequence to generate sequential numbers automatically:

```
CREATE SEQUENCE sequence

[INCREMENT BY n]

[START WITH n]

[{MAXVALUE n | NOMAXVALUE}]

[{MINVALUE n | NOMINVALUE}]

[{CYCLE | NOCYCLE}]

[{CACHE n | NOCACHE}];
```

## **Creating a Sequence**

- Create a sequence named DEPT\_DEPTID\_SEQ to be used for the primary key of the DEPARTMENTS table.
- Do not use the CYCLE option.

```
CREATE SEQUENCE dept_deptid_seq
INCREMENT BY 10
START WITH 120
MAXVALUE 9999
NOCACHE
NOCYCLE;
CREATE SEQUENCE succeeded.
```

#### **NEXTVAL and CURRVAL Pseudocolumns**

- NEXTVAL returns the next available sequence value. It returns a unique value every time it is referenced, even for different users.
- CURRVAL obtains the current sequence value.
- NEXTVAL must be issued for that sequence before CURRVAL contains a value.

### Using a Sequence

 Insert a new department named "Support" in location ID 2500:

 View the current value for the DEPT\_DEPTID\_SEQ sequence:

```
SELECT dept_deptid_seq.CURRVAL fROM dual;
```

## **Caching Sequence Values**

- Caching sequence values in memory gives faster access to those values.
- Gaps in sequence values can occur when:
  - A rollback occurs
  - The system crashes
  - A sequence is used in another table

## Modifying a Sequence

Change the increment value, maximum value, minimum value, cycle option, or cache option:

```
ALTER SEQUENCE dept_deptid_seq
INCREMENT BY 20
MAXVALUE 999999
NOCACHE
NOCYCLE;

ALTER SEQUENCE dept_deptid_seq succeeded.
```

# Guidelines for Modifying a Sequence

- You must be the owner or have the ALTER privilege for the sequence.
- Only future sequence numbers are affected.
- The sequence must be dropped and re-created to restart the sequence at a different number.
- Some validation is performed.
- To remove a sequence, use the DROP statement:

```
DROP SEQUENCE dept_deptid_seq;

DROP SEQUENCE dept_deptid_seq succeeded.
```

#### **Lesson Stanford**

- Overview of views:
  - Creating, modifying, and retrieving data from a view
  - DML operations on a view
  - Dropping a view
- Overview of sequences:
  - Creating, using, and modifying a sequence
  - Cache sequence values
  - NEXTVAL and CURRVAL pseudocolumns
- Overview of indexes
  - Creating, dropping indexes
- Overview of synonyms
  - Creating, dropping synonyms

## **Indexes**

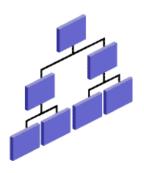

Object	Description
Table	Basic unit of storage; composed of rows
View	Logically represents subsets of data from one or more tables
Sequence	Generates numeric values
Index	Improves the performance of some queries
Synonym	Gives alternative names to objects

#### **Indexes**

#### An index:

- Is a schema object
- Can be used by the Oracle server to speed up the retrieval of rows by using a pointer
- Can reduce disk input/output (I/O) by using a rapid path access method to locate data quickly
- Is independent of the table that it indexes
- Is used and maintained automatically by the Oracle server

#### **How Are Indexes Created?**

 Automatically: A unique index is created automatically when you define a PRIMARY KEY or UNIQUE constraint in a table definition.

 Manually: Users can create nonunique indexes on columns to speed up access to the rows.

## **Creating an Index**

Create an index on one or more columns:

```
CREATE [UNIQUE] [BITMAP] INDEX index
ON table (column[, column]...);
```

• Improve the speed of query access to the LAST\_NAME column in the EMPLOYEES table:

```
CREATE INDEX emp_last_name_idx
ON employees(last_name);

CREATE INDEX succeeded.
```

#### **Index Creation Guidelines**

Cre	Create an index when:	
<b>✓</b>	A column contains a wide range of values	
<b>✓</b>	A column contains a large number of null values	
<b>✓</b>	One or more columns are frequently used together in a WHERE clause or a join condition	
<b>✓</b>	The table is large and most queries are expected to retrieve less than 2% to 4% of the rows in the table	
Do	Do not create an index when:	
X	The columns are not often used as a condition in the query	
×	The table is small or most queries are expected to retrieve more than 2% to 4% of the rows in the table	
X	The table is updated frequently	
X	The indexed columns are referenced as part of an expression	

## Removing an Index

 Remove an index from the data dictionary by using the DROP INDEX command:

```
DROP INDEX index;
```

 Remove the emp\_last\_name\_idx index from the data dictionary:

```
DROP INDEX emp_last_name_idx;

DROP INDEX emp_last_name_idx succeeded.
```

 To drop an index, you must be the owner of the index or have the DROP ANY INDEX privilege.

#### **Lesson Stanford**

- Overview of views:
  - Creating, modifying, and retrieving data from a view
  - DML operations on a view
  - Dropping a view
- Overview of sequences:
  - Creating, using, and modifying a sequence
  - Cache sequence values
  - NEXTVAL and CURRVAL pseudocolumns
- Overview of indexes
  - Creating, dropping indexes
- Overview of synonyms
  - Creating, dropping synonyms

## **Synonyms**

Object	Description
Table	Basic unit of storage; composed of rows
View	Logically represents subsets of data from one or more tables
Sequence	Generates numeric values
Index	Improves the performance of some queries
Synonym	Gives alternative names to objects

## **Creating a Synonym for an Object**

Simplify access to objects by creating a synonym (another name for an object). With synonyms, you can:

- Create an easier reference to a table that is owned by another user
- Shorten lengthy object names

```
CREATE [PUBLIC] SYNONYM synonym

FOR object;
```

## **Creating and Removing Synonyms**

Create a shortened name for the DEPT\_SUM\_VU view:

```
CREATE SYNONYM d_sum

FOR dept_sum_vu;

CREATE SYNONYM succeeded.
```

Drop a synonym:

```
DROP SYNONYM d_sum;

DROP SYNONYM d_sum succeeded.
```

#### **Summary**

In this lesson, you should have learned how to:

- Create, use, and remove views
- Automatically generate sequence numbers by using a sequence generator
- Create indexes to improve speed of query retrieval
- Use synonyms to provide alternative names for objects

## **Practice 7: Creating Other Schema Objects**

This practice covers the following topics:

- Creating sequences
- Using sequences
- Creating nonunique indexes
- Creating synonyms
